

# Snell's Law

# Recall...

- As waves travel from deep to shallow water, the direction of motion of the wavefront changes because the speed of the wavefront changes.
- The degree of this change depends on how much the speed of the wavefront changes.

Master

**Appendix 1.5: Derivation of Snell's Law**

The diagram represents the incident and refracted wavefronts and wave rays. As the wavefront passes from the fast ("lighter") medium to the slow ("heavier") medium, the wavefront slows down and bends.

Consider the wavefronts.

fast medium

Incide

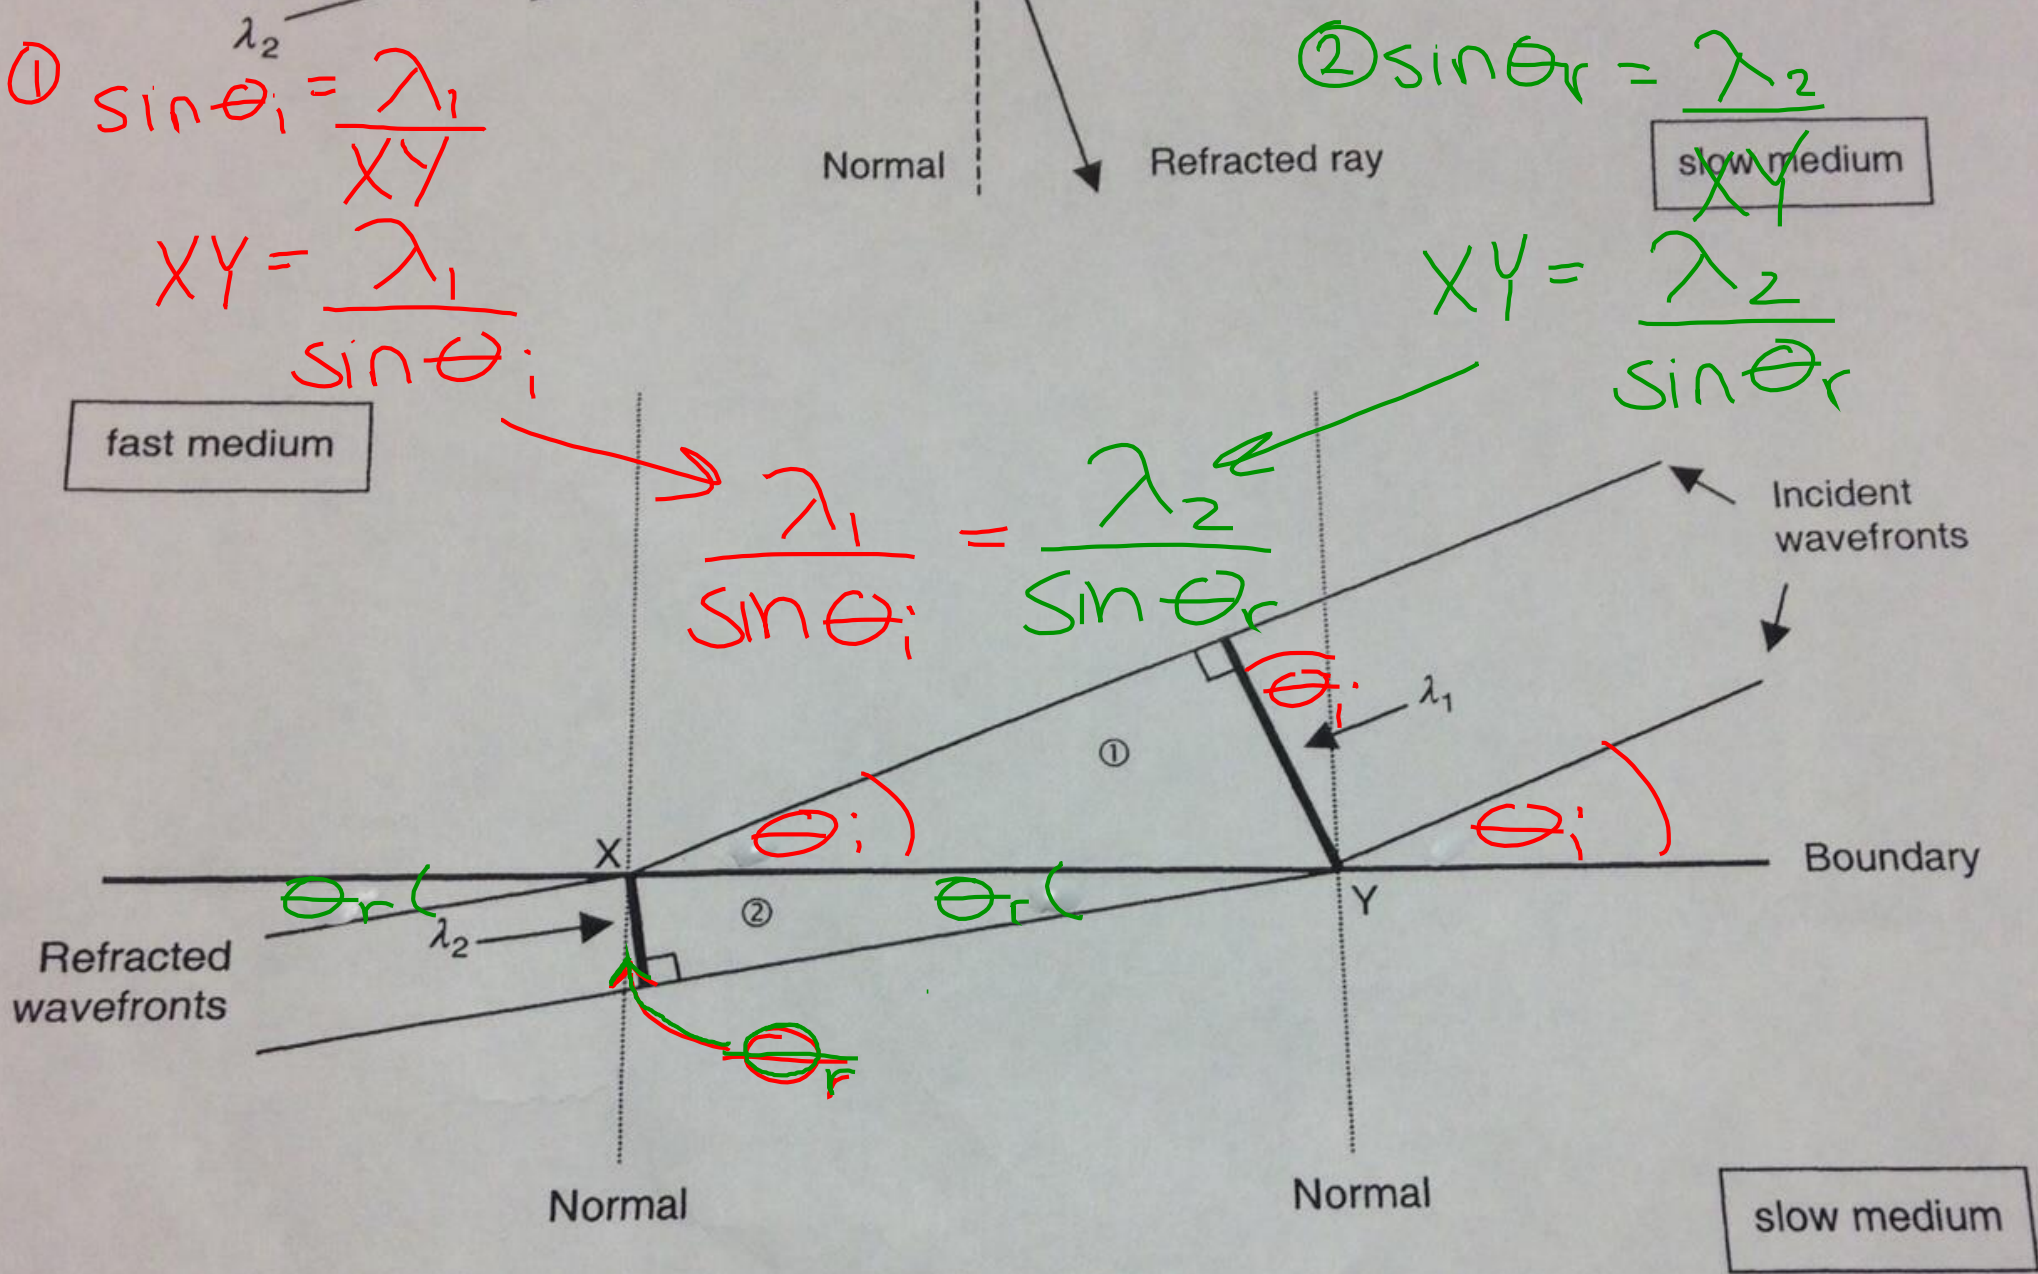

$$\textcircled{1} \sin \theta_i = \frac{\lambda_1}{XY}$$

$$XY = \frac{\lambda_1}{\sin \theta_i}$$

$$\textcircled{2} \sin \theta_r = \frac{\lambda_2}{XY}$$

$$XY = \frac{\lambda_2}{\sin \theta_r}$$

$$\frac{\lambda_1}{\sin \theta_i} = \frac{\lambda_2}{\sin \theta_r}$$

From the diagram...

$$\frac{\lambda_1}{\sin \theta_i} = \frac{\lambda_2}{\sin \theta_r}$$

$$\frac{\lambda_1}{\lambda_2} = \frac{\sin \theta_i}{\sin \theta_r}$$

$$\frac{v_1}{v_2} = \frac{\sin \theta_i}{\sin \theta_r}$$

index of  
refraction

Example:

- Draw the direction of motion and  $\theta_i$
- Find the index of refraction
- Find  $\theta_r$
- Draw refracted wavefronts

$$b) \frac{v_1}{v_2} = \frac{7.2}{5.2} = 1.4$$

$$c) \frac{v_1}{v_2} = \frac{\sin \theta_i}{\sin \theta_r}$$
$$1.4 = \frac{\sin \theta_i}{\sin \theta_r}$$
$$\sin \theta_r = \frac{\sin 38^\circ}{1.4}$$
$$\theta_r = 26^\circ$$
